TITLE: Is It Possible to Transmit Tick-borne Encephalitis via the Placenta or via the Mother's Milk?

PERIODICAL: Zhurnal mikrobiologii, epidemiologii i immunobiologii, 1959, ²Nr 9, pp 94-97 (USSR)

ABSTRACT: Three case histories are quoted of nursing mothers with various forms of tick encephalitis. These indicate that the infection is not transmitted to the nursing infant through the mother's milk, nor is it passed on during the birth process.

TITLE: The channel waves P_a and S_a in the upper mantle of the earth

SOURCE: AN GruzSSR. Soobshcheniya, v. 39, no. 1, 1965, ^{12,44,55} 55-58

TOPIC TAGS: earthquake, seismic wave, earth crust

ABSTRACT: Investigations of P_a and S_a waves were made by means of records from 1947 to 1960 of the Tsentral'naya Tbilisskaya seysmicheskaya stantsiya (Central Tbilisi Seismological Station) of earthquakes having epicentral distances greater than 3000 km. These are tabulated in the article. Magnitudes ranged from 6 to 8, and foci were located in the crust and the subcrustal layer. A Galitzin instrument was employed. Investigations showed that P_a and S_a waves were observed on these records for all propagation directions, but they do not appear on all records. Both waves were recorded on all three components. The P_a show best on the vertical record. Records of P_a and S_a are clearest on earthquakes at distances exceeding 50° . They become difficult to distinguish on records of nearer quakes. The periods are variable, ranging from 5 to 20 seconds for P_a and

Card 1/2

L 3507-66

ACCESSION NR: AP5020106

8 to 30 seconds for S_a , but being chiefly 8-12 and 12-20 seconds, respectively. They tend to increase with epicentral distance. They are more intense than PP, PPP, and other waves. The travel-time curves appear rectilinear, and the average velocities are 8.35 km/sec for P_a and 4.5 km/sec for S_a . These data indicate a layer of lower velocity in the upper mantle of the earth. Orig. art. has: 1 figure and 1 table. 3

<p>621.314.925.001.4 : 621.313.322 : 621.314.2</p> <p>2000. Testing of the relay protection of generators and power transformers. Yerenkov, I. K. <i>Elek. St.</i>, 20, 36-8 (Mosk., 1949) In Russian. The new method works satisfactorily and gives further data on the transformer protection. The permanent installation on power stations of a supply of 220 and 380 V d.c. is recommended for rapidly carrying out such tests whenever required. The currents which can safely be used for about 2 min are of the order of 3-15-0.2 of the rated generator current, provided that intervals of 5-7 min elapse between individual tests. Current vector diagrams can be taken with great ease, as the network voltage is in-phase with the testing current. The method reduces the time for testing the protection to about 1/3 of that required by other methods. S. F. Title : Interoceptive influences from the stomach and the small intestines on diaphragm functions, thoracic respiratory musculature and blood pressure

Periodical : Fiziol. zhur. 40, 332-337, May/Jun 1954

Abstract : Results of study of respiratory movements of the thorax and of blood pressure in experimental dogs led to the solution of some aspects of reflex relationship between the diaphragm and the digestive tract, the respiratory apparatus, and the cardiovascular system. Interoceptive influences, emanating from the stomach and small intestines, cause substantial changes in the diaphragm functions, its tonus, and amplitude of its movements. This is due to the fact that both the topographic anatomy and the function of diaphragm movements are closely related to the respiratory apparatus, the cardiovascular system, and the digestive organs. Diaphragm function reflex changes are in opposite relationship with reflex shifts in the function of the thoracic respiratory musculature, irrespective of the diaphragm's qualitative reaction to interoceptive influences emanating from the stomach and small intestines. Diagrams. Eight Soviet references.

or electric current stimulation of the afferent nerves of the intestines in a state of anesthesia led to a reflex drop of the tone of the diaphragm, a drop in blood pressure, and in increase in the tonus of the thoracic respiratory musculature; a reverse picture was observed during the stage of recovery from anesthesia. The reflex influence on the respiratory musculature was preserved with sectioning of the vagus nerves and disappeared with sectioning of the spinal cord between the cervical and thoracic segments. The depressor effect on the blood pressure from the stomach and intestines was also retained after bilateral cervical vagotomy. Elevation of pressure in the rectum to 100 - 200 mm

TITLE: On the Calculation of Small Horizontal Settling Tanks for Water Taken From Canals, Rivers, and Ponds (O raschete gorizonta-
tal'nykh otstoynikov malykh razmerov pri zabore vody iz
kanalov, rek i prudov)

PERIODICAL: Sb. tr. Novocherkas. inzh.-melior. in-ta, 1955, Vol 5,
pp 89-96

ABSTRACT: Engineering cost analyses have led the author to the conclusion that for small consumers of water (70-200 m³/day) horizontal settling tanks, in conjunction with slow filters, constitute the most sensible device for clearing water obtained from canals for agricultural purposes. The results of laboratory investigations on the effects of various modes of inflow and outflow of water in the settling tank are adduced. The author examines the basic calculation formula for horizontal settling tanks comprising the correction factor introduced by Turchinovich (Turchinovich, V.T., Uluchsheniye kachestva vody. Stroyizdat, 1940) and proposes the following relationship for

Card 1/2

On the Calculation of Small Horizontal (cont.)

a coefficient that is to account for the nonuniformity of the velocities in the settling tank:

$$\alpha_2 = a / \sqrt[3]{v}$$

where a is a variable empirical coefficient, the magnitude of which is adduced in the paper. A numerical example is given.

 Orig Pub. : Sb. nauchn. tr. Dagest. med. in-t, 1956, 6, 163-170
 Abstract : The rules and regulations of the formation of filtrable forms of the strangles streptococcus are noted. The secondary cultures regenerated from the filtrable forms are characterized by slow growth, the absence of biochemical activity and of virulence. On the basis of the characteristic sequence or change in the morphology of the secondary cultures in the regeneration process the author regards the filtrable forms of this streptococcus as one of the stages in the development of the microbial population. —V. G. Petrovskaya.

the Antivirus

Orig Pub : Sb. nauchn. tr. Dagest. med. in-t, 1956, 6, 171-173

Abstract : 4 strains were exposed to the action of antivirus prepared according to Besredka's method for over 5 months. The antivirus inhibited the growth of Str. equi and caused a sharp polymorphism of cells and their disintegration with the formation of filterable forms and subsequent regeneration of secondary cultures in the form of very minute micrococci, growing into dwarf colonies.

1561. **Microflora and Morphology of Bile in Cholecysto-
cholangitis.** (Микрофлора и морфология желчи при
холецистоангиохолитах)
M. A. YERESKO. Клиническая Медицина [Klin. Med.,
Mosk.] 27, 27-34, Dec., 1949.

Of 220 cases of cholecysto-angiocholitis investigated, in 29% the bile was sterile and in 71% it contained bacilli. In 10% of cases saprophytic organisms were found, but these were aetiologically unimportant. Bile culture gave the following organisms: (1) streptococci in 36%; (2) mixed flora with preponderance of streptococci in 26%; (3) enteric-group bacilli in 17.8%; (4) mixed flora with preponderance of the enteric group in 11.2%; (5) staphylococci in 9%. Morphological and bacteriological investigations of the bile make it clear that the basic foci of inflammatory change lie mostly in the deep bile ducts and in the gall-bladder, and to a lesser extent in the common bile duct.

TITLE: Analysis of Error in Determining Positions of Foci of Earthquakes in the Crimea (Issledovaniye oshibok opredeleniya polozheniya ochagov krymskikh zemletryaseny)

PERIODICAL: Trudy Geofizicheskogo instituta, AN SSSR, 1956, Nr 36, pp. 3-14 (USSR)

ABSTRACT: The author uses the Wadati method to verify the accuracy of epicenter and foci positions (and the depth of location of the latter) which had been determined earlier on the basis of instrumental observations made by Crimean regional seismic stations of earthquakes occurring in the Crimea between 1928-1941. An analytic expression in the Wadati method by means of the determination of the mean quadratic error makes it possible to evaluate the accuracy of the calculation of the coordinates and depths of the foci. There are 2 tables, 1 figure, and 4 references, all USSR.

TITLE: Viscosity of tin and of its alloys with nickel

SOURCE: IVUZ. Chernaya metallurgiya, no 9, 1965, 8-12

TOPIC TAGS: tin alloy, nickel containing alloy, fluid viscosity, metal melting, atom

ABSTRACT: The elucidation of certain semiempirical patterns of relationship between the viscous properties of melts and their molecular structure is of major practical significance. To this end, the authors chose for investigation a Sn-Ni system (zone-refined 99.9997% pure Sn and electrolytic Ni) containing up to 9% (at.) Ni. Viscosity was studied in a He atmosphere by measuring the damping decrement of the torsional oscillations of a cylindrical crucible of spectrally pure graphite containing the melt. The viscosity of Sn-Ni alloys was determined in two series of measurements. In the first series the damping decrement was measured during both the heating and the cooling of specimens. Alloys containing 0.51, 1.8, 3.0, 5.45 and 9.0% (at.) Ni were investigated. All the alloys revealed hysteresis phenomena (due to the presence of minute impurities -- oxides -- in zone-refined Sn), and in the alloys with 5.45 and

UDC: 669.6'24-154:532.13

Card 1/3

L 12174-66

ACC NR: AP6000171

9% Ni the hysteresis loop changed into a branched curve, which may be attributed to the presence of a refractory structural component in the structure of the solid specimens. During the second series, alloys containing 1.0, 1.82, 3.0, 4.0 and 9.0% (at.) Ni were investigated. The specimens were first heated to 900-1000°C and kept for some time at this temperature before measuring the damping decrement during cooling. The plotted isotherms of viscosity showed that viscosity increases with the Ni content of the alloy particularly when this content is increased to 2% and the temperatures are within the 400-600°C range. It is shown that the Einstein formula for colloidal solutions:

$$\eta = \eta_0 \left(1 + 2.5 \frac{v}{V} \right), \quad (1)$$

(where η and η_0 are the viscosities of the melt and the pure solvent, v is the total volume of the first coordination spheres of dissolved atoms, and V is the volume of the melt) may be applied to describing the viscosity properties of diluted metal solutions with strongly interacting atoms, on the ground that, in the event of a strong interaction between heterogeneous atoms to an extent exceeding the energy of thermal motion, the atoms of the solvent in the neighborhood of the atom of the dissolved component (within the confines of the first or even the second coordination spheres) display a much smaller mobility than in the remaining volume of the solution.

Card 2/3

L 12174-66

ACC NR: AP6000171

These findings may be explained as follows: When the Ni content and the heating temperature are not too high, the complexes constituted by the solute atom and the neighboring bound atoms may be considered as rigid spherical formations which are spaced so far apart that their interaction may be disregarded. Increasing the Ni content above 2% (at) leads to such an increase in the number of complexes and such a pronounced change in the hydrodynamic conditions within the melt that the mechanism of viscous flow in which the structural units are atoms of the solvent (Sn) and complexes becomes inexpedient from the standpoint of energetics and is replaced by a mechanism in which the units of flow are represented by individual atoms of the components. This is why further addition of Ni causes a less sharp increase in melt viscosity. Orig. art. has: 5 figures, 4 formulas.
